Product

Product description:

Inward opening windows for use in exterior walls of domestic and commercial buildings.

Product specification:

25% of aluminium and 7% of glass is produced from recycled material.

Product group KS, KN, KU, ES, EN, EU is covered in this EPD. The highest amount for constituent material has been used.

| Materialer | | kg | % |
|------------------|--------------|-------|-------|
| Pine timber | | 17.79 | 25.31 |
| Glue for timber | | 0.13 | 0.19 |

Technical data:

Inward opening windows. Triple glazed or double glazed with secondary sash, 115mm frame with aluminium clad. Uwin 1,0 - 1,2 W/m2K. Manufactured in accordance with ISO 9001:2015 and ISO14001:2015. Certified: Bluesky, SP Sitac "P",

The total product weight is 70.28 kg. The packaging has an average weight of 4.6 kg.

Market:

Europe, but scenarios beyond cradle to gate are based on the situation in the Norwegian market.

Reference service life:

The reference service life is 60 years for aluminium cladding timber frame

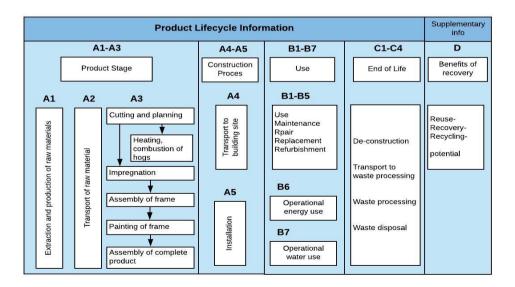

LCA: Calculation rules

Functional unit:

1 window measuring 1.23 m x 1.48 m (reference window based on EN 14351-1) with an expected service life of 60 yrs. with an essential parameter U-value = 1,0 - 1,2 W/m2K. Conversion factor is 70.28 [Kg/FU].

System boundary:

All modules are included. Below is a technical flowchart for the production line at Nordan. Modul D is calculated with energy substitution and explained in the scenarios.

Data quality

Data is representative of year 2020 and was collected in 2021-2022. Data is taken from processes from Ecoinvent 3.1-3.7. Some processes are based on Ecoinvent v3.1 (2014) and v3.2 (2015), but all upstream processes are v3.4 (2017)-3.5 (2018). Remaining data is based on Ecoinvent v3.7 (2020). "Allocation cut-off by classification" adjusted to improve representativeness.

Allocation:

Allocation is done in accordance with the provisions of EN 15804. Allocation of energy, water and waste from production is calculated by a physical allocation factor based on the manufacturer input. For waste produced at the manufacturing, the burdens for reuse, recycling and recovery is allocated by using this allocation factor.

Cut-off criteria:

All raw materails and energy use is included. Where data was available for infrastructure from Ecoinvent, it is included. Example: 'Metal working factory'. In the production process, raw materials and energy of low amounts are not included (<1%). These cut-off rules do not apply to dangerous substances.

Calculations of biogenic carbon:

Sequestration and release of biogenic carbon is included according to EN 16485:2014. This is based on the modularity principle in EN 15804:2012 that specifies that the emissions shall be accounted in the module that they occur. The amount of carbon dioxide sequestrated is calulated in accordance to EN 16449:2014. Timber comes from sustainable forestry and has FSC certified traceability.

LCA: Scenarios and additional technical information

The following information describe the scenarios in the different modules of the EPD

The transportation from production to construction site is based on a scenario where the product is transported on a large lorry from Kvillsfors, Sweden to Oslo, Norway (500 km) and then to a warehouse which is assumed to be in a 250 km radius from Oslo. Transport from warehouse to a construction site is assumed to be 50 km on a medium truck.

Transport from production place to assembly/user (A4)

| Туре | Capacity utilisation | Type of vehicle | Distance km | Fuel/Energy | Fuel/Energy |
|-------|----------------------|-------------------|-------------|--------------------|-------------------|
| | (incl. return) % | | | consumption pr tkm | consumption pr km |
| Truck | 53 | EURO5, >32 tonn | 750 | 0.023 l/tkm | 0.31 l/km |
| Truck | 26 | EURO5, 16-32 tonn | 50 | 0.045 l/tkm | 0.25 l/km |

Installation (A5)

| | Unit | Value |
|---------------------------------------|-------|-------|
| Auxiliary | kg | 0 |
| Water consumption | m^3 | 0 |
| Electricity consumption | MJ | 0 |
| Other energy carriers | MJ | 0 |
| Material loss | kg | 0 |
| Output materials from waste treatment | kg | 0.53 |
| Dust in the air | kg | 0 |

According to the report from EPD-Norge 'Harmonising the documentation of scenarios beyond cradle to gate, EN 15804' there is no loss on site during construction activities. The window products in this EPD are painted and surface treated in the production and not at the building site. Therefore, there is only 2 items left in this module. 1) Waste treatment of packaging which is considered in the EPD calculations. 1) Energy use during installation. This can be varied depending on the floor, type of building and several other unknown parameters, and therefore ignored in the calculation.

Maintenance (B2)/Repair (B3)

| | Unit | Value (alu cladding) |
|-------------------|------|----------------------|
| Detergents | kg | 9 |
| Water consumption | | 180 |
| Lubricating oil | kg | 0.30 |
| Paint | kg | 0.55 |
| Transport | tkm | 2.95 |
| Glazing unit | kg | 41.04 |
| Synthetic rubber | kg | 1.09 |
| Transport (IGU) | tkm | 12.31 |

The maintenance scenario included cleaning, painting and change of IGU. Cleaning is performed three times per year. It is calculated with 1,5 dl of detergent and 3 litres of water each year. Windows with aluminium cladding are assumed to be painted 3 times during its lifetime from inside. It is assumed that 5 gr of lubricating oil is used every year for fittings and moving parts. The glazing unit is changed once during the lifetime for the windows with aluminium cladding. No repair is assumed during the product lifetime.

Replacement (B4)/Refurbishment (B5)

| | Unit | Value |
|---------------------------|------|-------|
| Replacement cycle* | yr | 60 |
| Electricity consumption | kWh | 0 |
| Replacement of worn parts | 0 | 0 |

* Number or RSL (Reference Service Life). The window has RSL of 60 years. Therefore, it is assumed to replace the insulated glass unit after 30 years (See Module B4). There is no need for refurbishment during the product lifetime.

(C1) As there are no data for de-construction, it is assumed no activites in C1 in this study. The windows are assumed to be treated as mixed waste and sent to incineration. The combustible materials are then energy recovered, while glass is assumed to end up in the bottom ash and then landfilled. The metals are usually sorted out of the bottom ash and then recycled, but there is no data of the share which are recycled and therefore standard values from Ecoinvent is utilized.

The transport of window as waste is calculated based on a scenario with 50 km distance.

Transport to waste processing (C2)

| Type | Capacity utilisation | utilisation Type of vehicle | | Fuel/Energy | Fuel/Energy | |
|-------|----------------------|-----------------------------|----|--------------------|-------------------|--|
| | (incl. return) % | | | consumption pr tkm | consumption pr km | |
| Truck | 44 | Unspecified | 50 | 0.03l/tkm | 0.28 l/km | |

Windows are assumed to be sorted as mixed construction waste and treated with incineration with energy recovery. However, the manufacturer has documented the recycling potentials for its product in the Construction Product Declaration eBVD Kvillsfors inåtgående fönster - EN, ID: C-SE556294452901-101 URL: https://www.ebvd.org/BMI/Document/Export/6278/0/Pdf Kvillsfors inåtgående fönster - ES, ID: C-SE556294452901-118 URL: https://www.ebvd.org/BMI/Document/Export/6593/0/Pdf Kvillsfors inåtgående fönster - KN, ID: C-SE556294452901-119 URL: https://www.ebvd.org/BMI/Document/Export/6644/0/Pdf Kvillsfors inåtgående fönster - KS, ID: C-SE556294452901-121 URL: https://www.ebvd.org/BMI/Document/Export/6653/0/Pdf In the documentation, Chapter 10, the specific material recovery, and energy recovery potential is reported for the product.

End of Life (C1, C3, C4)

| | Unit | Value |
|---------------------------------------|------|-------|
| Hazardous waste disposed | kg | 0 |
| Collected as mixed construction waste | kg | 70.28 |
| Reuse | kg | 0 |
| Recycling | kg | 3.40 |
| Energy recovery | kg | 66.88 |
| To landfill | kg | 0.00 |

The benefits beyond life cycle has been modelled based on the output flows from module C3. This includes energy from incineration and scrap metal recovered from the ashes. The amount recovered metal is assumed to avoid production of primary metals in accordance to 6.4.3.3 in EN 15804. The exported energy is substituting Norwegian district heating mix and electricity mix. Inventory processes causing substitution of avoided virgin raw materials has be constructed for each material.

Benefits and loads beyond the system boundaries (D)

| | | Value (alu |
|--------------------------------|------|------------|
| | Unit | cladding) |
| Substitution of electricity | MJ | 33.5 |
| Substitution of thermal energy | MJ | 304.9 |
| Substitution of raw materials | kg | 3.4 |

LCA: Results

Global warming potential in A1-A3 includes sequestration of CO2 as carbon in the wood. This amount is accounted as an emission in module C3. Additionally, it is included sequestration in the wood packaging. This is accounted as an emission in module A5. The flow of biogenic carbon for the system is presented in page 9.

CR Components for reuse; MR Materials for recycling; MER Materials for energy recovery; EEE Exported electric energy; ETE Exported thermal energy

Reading example: $9.0 \text{ E}-03 = 9.0 \times 10^{-3} = 0.009$

Norwegian additional requirements

Greenhouse gas emissions from the use of electricity in the production phase

National (Sweden) market with low-voltage, including imports, direct emissions, infrastructure and transmission losses, has been used for electricity in the production process (A3). The manufacturer is documented the use of electricity from hydropower with guarantees of origin, which has 6 fold less GWP effect. However, the final result has only be improved by 0.6% in A1-A3 production. Therfore, the national electricity mix is considerd.

| Data source | Quantity | Unit |
|---------------------------------|----------|--------------------------------|
| Ecoinvent v3.7 (september 2020) | 41 | gram CO ₂ -ekv./kWh |

Hazardous substances

| | The product contains no substances from REACH Candidate List or the Norwegian Priority List |
|----------|--|
| V | The product contains substances below 0.1% by weight on the REACH Candidate List |
| | The product contains substances from REACH Candidate List or the Norwegian Priority List, see table under Specific Norwegian requirements. |
| | The product does not contain any substances on the REACH Candidate List or the Norwegian Priority List. The product can be characterized as hazardous waste (according to the Waste Shift, Appendix III), see table under Specific Norwegian requirements. |

Transport

Transport from production site to construction site according to scenario in A4: 750+50 km

Indoor air quality

The product has not been tested for emissions to indoor environments.

Carbon footprint

To increase the transparency of the climate impacts, the GWP indicator has been divided into sub-indicators:

GWP-IOBC Climate impacts calculated according to instant oxidation principle

GWP-BCIP Climate impacts calculated from the net impacts of sequestration and emission of biogenic carbon

| Climate imp | pact with alu | clad | | | | | | | |

Additional information

For the products with different sizes from the declared unit, the environmental impacts must be converted by using a conversion factor. The Norwegian EPD Foundation has published instructions on how to interpret EPDs for windows on its website (www.epd-norge.no) where different calculation methods have been stated. (Document: Bruksanvisninger i hyordan tolke EPD'er – Vinduer)
